

The mechanical sub-soil applicator works exceptionally well and a larger feed belt is the only modification that the Cronaus would alter in a re-design.

Andrew, who has supported the project, explained that the process opens a window into the subsoil allowing for healthy root growth.

"The compost window improves root penetration, nutrient uptake and moisture availability," he said. "The applicator gives us the capacity to apply compost to sub soil layers at depths of up to 40cm conveniently and cost effectively meaning we can increase the area treated, assess the most beneficial application rate and determine the economic viability of the treatment," he added.

In subsoils where aeration, soil water-holding capacity and root growth are impeded, amelioration applications such as compost may assist in the prevention of waterlogging through enabling drainage to the deeper soil profile.

SRA's Dr Barry Salter is currently leading a project to determine the varying response rates in treatments that are applied to different soil types and to determine the long-term feasibility of subsoil ameliorant applications.

Interest in this field is growing with a number of other projects underway throughout the industry and our knowledge of farming on marginal soils steadily improving.

**Left image:** Highlighted in the red circle is where the compost was originally placed in 2012. You can see the higher density of root mass in this area 'opening a window' for root growth in the surrounding sub-soil; ideally increasing the available moisture and nutrient uptake.

## NCEA receives funding for smarter irrigation

Dr Joseph Foley and a team of National Centre for Engineering in Agriculture (NCEA) researchers have started working with 16 R&D partners and up to 19 farmer-managed learning sites in a \$3.7 million Federal Government funded Rural R&D for Profit programme to improve the profit of each individual irrigator enterprise across the cotton, dairy, sugar and other agricultural sectors by \$20,000-\$40,000 per annum.

This project is being led by the Cotton Research and Development Corporation (CRDC) in conjunction with three others RDCs; Sugar Research Australia, Dairy Australia, and the Rural Industries Research and Development Corporation (RIRDC).

"This is a large-scale, ambitious project designed to achieve a 10-20 percent improvement in water productivity, efficiency and farmer profitability, while also improving cross-sector industry research collaboration," said Bruce Finney, Cotton Research Development Corporation Executive Director.

"It is designed to increase on-farm profitability by integrating new irrigation scheduling and delivery technologies into good irrigation practice.

"It will build on previous research to drive additional improvements in cotton and rice, and will transfer learnings from the cropping industries to dairy.

"Our aim is to increase on-farm profit through the adoption of automated and precision application technologies across all industries."
